

The below use case outlines a scenario that provides context to the questions you will be asked in the assessment. You may find this useful to refer to when answering the questions.

Use case

You work for an organization that has just purchased Pyramid software and they have tasked you with getting it configured. There will be a total of 200 users so according to the Pyramid Scaling Guide, it would qualify as a medium-sized deployment.

They need to make the application available to both internal and external users. The external users' environment should be isolated to avoid accidental exposure to internal data.

A small group of users (Group A) will be responsible for creating and maintaining all Data Models and the core content in the Public Folder. All other users should NOT have access to the Data Modeling module.

Specific folders will be created in Public for Groups B, C, etc. to store their content and share with the organization but they will only have the ability to save in that specific folder.

There will be a number of models and publications so it is recommended that the product is scaled-out to support the performance of these tasks, regardless of how the rest of the services are scaled. As part of your administrative duties, you will be tasked with monitoring performance, usage, and maintaining data security.
